

Q → Product of elements except itself

```
public static void main(String[] args) {
    Scanner scn = new Scanner(System.in);
    int n = scn.nextInt();
    int[] arr = new int[n];

    for (int i = 0; i < n; i++) {
        arr[i] = scn.nextInt();
    }

    int[] lprod = new int[n];
    int[] rprod = new int[n];

    lprod[0] = arr[0];
    for (int i = 1; i < n; i++) {
        lprod[i] = lprod[i-1] * arr[i];
    }

    rprod[n-1] = arr[n-1];
    for (int i = n-2; i >= 0; i--) {
        rprod[i] = rprod[i+1] * arr[i];
    }

    for (int i = 0; i < arr.length; i++) {
        if (i == 0) {
            System.out.println(rprod[i+1]);
        } else if (i == n-1) {
            System.out.println(lprod[i-1]);
        } else {
            int prod = lprod[i-1] * rprod[i+1];
            System.out.println(prod);
        }
    }
}
```

Q

For each index,

Store 1 at that index if the element at that index is **greater than zero**.

Store 0 at the index if the element at that index is **equal to zero**.

Store -1 at the index if the element at that index is **less than zero**.

In the end print the complete array one by one.

```
public class Solution {
```

```
    public static void main(String[] args) {  
        Scanner scn = new Scanner(System.in);  
        int n = scn.nextInt();  
        int[] arr = new int[n];
```

```
        for(int i=0; i<n; i++){  
            arr[i] = scn.nextInt();  
        }
```

```
        for(int val: arr){  
            ✓ if(val==0){  
                ✓ System.out.print("0 ");  
            }  
            ✓ else if(val>0){  
                ✓ System.out.print("1 ");  
            }  
            ✓ else{  
                ✓ System.out.print("-1 ");  
            }  
        }
```

```
        /* Enter your code here. Read input from STDIN. Print output to STDOUT. Your code ends here */  
    }
```

Soln

Take n as an integer input representing size of both array.

Take n integer inputs for numbers array and Then take n integer inputs for array indexes where each integer input can be from 0 till numbers.length.

↳

Then create an array of size n and name it target array. From left to right read numbers[i] and index[i], and in the target array at the index index[i], insert the value numbers[i].

Input Format

numbers =

0	1	2	3	4	5	6
12	9	2	13	3	14	6

indexes =

1	4	6	0	2	3	5
---	---	---	---	---	---	---

target arr =

13	12	3	14	9	6	2
0	1	2	3	4	5	6

```
public static void main(String[] args) {
    Scanner scn = new Scanner(System.in);
    int n = scn.nextInt();
    int[] number = new int[n];

    for(int i=0; i<n; i++){
        number[i] = scn.nextInt();
    }

    int[] indexes = new int[n];
    for(int i=0; i<n; i++){
        indexes[i] = scn.nextInt();
    }

    int[] target = new int[n];
    for(int i=0; i<n; i++){
        int idx = indexes[i];
        target[idx] = number[i];
    }

    for(int val : target){
        System.out.print(val + " ");
    }

    /* Enter your code here. Read input from STDIN. Print output to STDOUT.
}
```

i *i* *i* *i* *i*
↓ ↓ ↓ ↓ ↓

0	1	2	3	4
18	45	9	30	27

index

4	3	0	2	1
0	1	2	3	4

target

9	27	36	45	18
0	1	2	3	4

idx = 4/3
2/0
1/1

Ques

Given an array of size n with initial values. Take left, right as integer inputs such that $0 \leq \text{left}, \text{right} < \text{arr.length}$ and also take x as an integer input.

Then update the given array from the **index-left** till the **index-right** (both left index and right index included) with the element x . In the end print all the elements of the array such that each element is printed in a separate line.

✓ $\text{st} = 2$

✓ $\text{end} = 6$

✓ $x = 0$

=

2

Take an **array arr** of size **N** as input which represents a **large number**.

Add **1 (one)** to this large number and print the resultant array.

eg:- [4,2,3,6,5,8,7,1,5,3,9,6] In this case answer must be [4,2,3,6,5,8,7,1,5,3,9,7]

Note: The large integer does not contain any **leading 0's** in the array.
